

Storyboard Mockups for a Memory Game

Created by Todd Violette

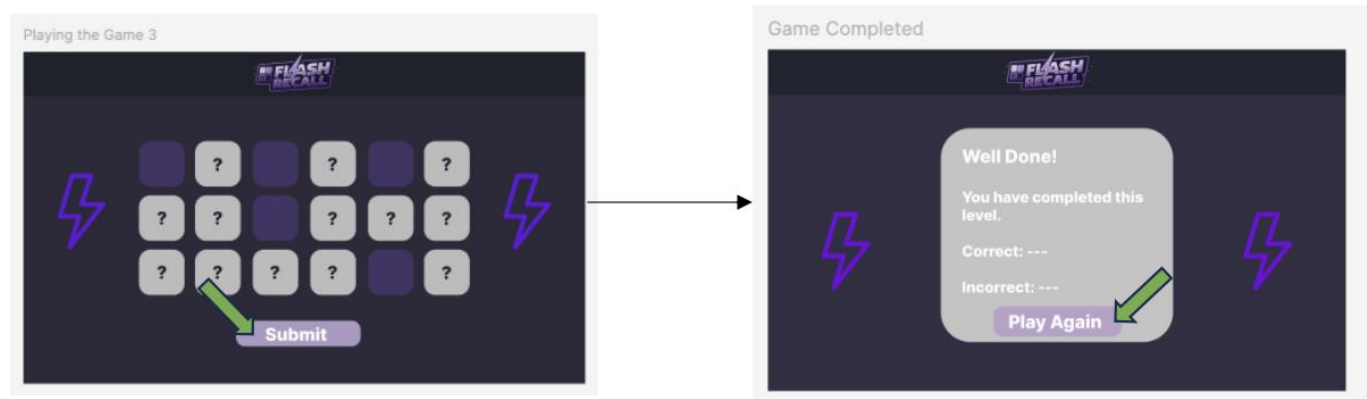

Storyboard 1:

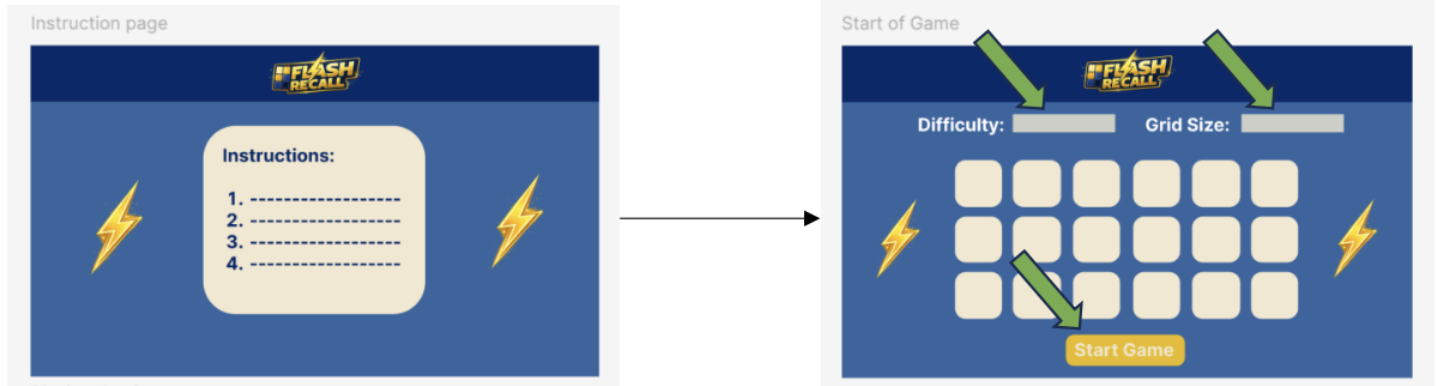

Once the user clicks on the website, they are directed to the landing section where instructions of the game are presented. Users must then select the difficulty and grid size before clicking "Start Game".

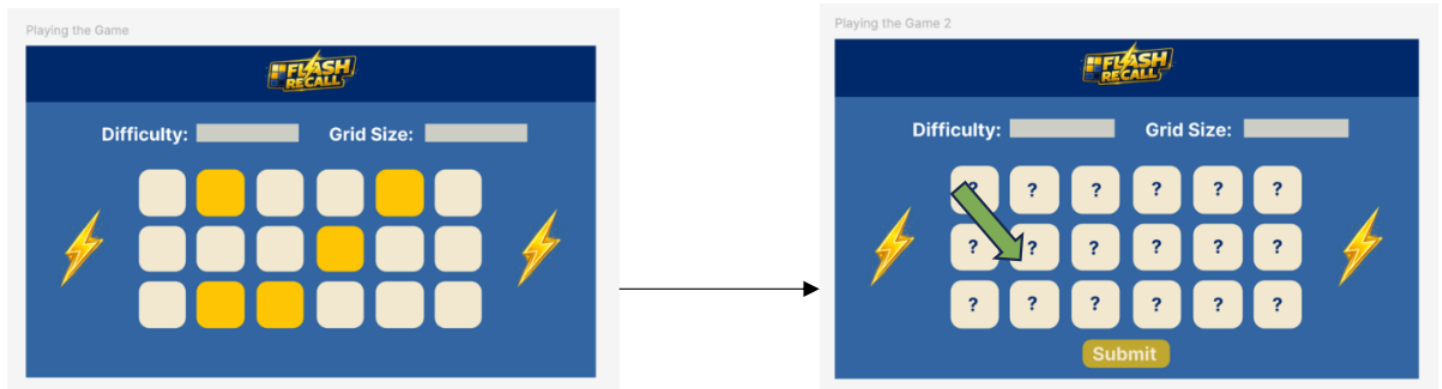

The grid will then show a random selection of tiles in a different colour for a limited amount of time. Once the timer ends, the user must select which tiles were previously highlighted by another colour. This is where their memory will be tested.

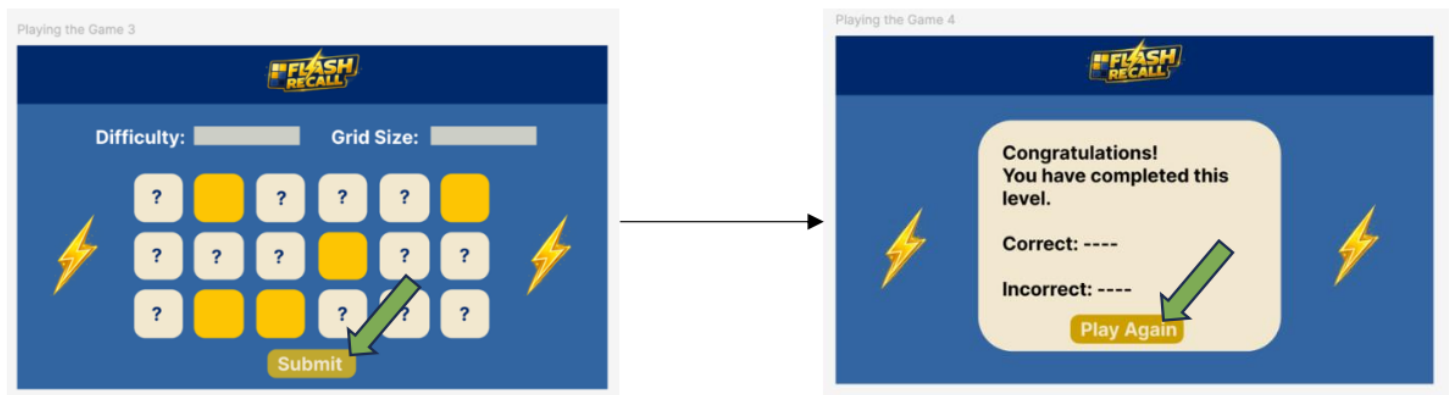

Storyboard 2:

The user will arrive on the landing section where instructions of the game will be presented. Once the user understands the game, they must select the difficulty and the grid size before starting the game.

Once the game starts, a random selection of tiles will be shown in a different colour for a short amount of time. The user then must select which tiles were previously highlighted in another colour.

When the user is satisfied with their selection, they click the submit button and it will show how many of their answers were correct or incorrect. They can then click the "Play Again" button.
